Cyber Fire Entry Point Course

Instructors:

Aaron Scott Pope <apope@lanl.gov>

James Wernicke <wernicke@lanl.gov>

Pablo Arias <arias13@llnl.gov>

Heather Keaty <hkeaty@lanl.gov>

Additional Content Creators:

Shannon Beck <shannon@lanl.gov>

Neale Pickett <neale@lanl.gov>

Paul Ferrell <pferrell@lanl.gov>

“Given enough time, any man may master the physical. With enough knowledge, any man may become wise. It is the true warrior who can master both....and surpass the result.” – Tien T'ai

CYBERFIRE

What is Cyber Fire Foundry?

- Cyber Fire Foundry guides you through creating custom solutions for investigating cybersecurity incidents.
- Rather than teach recipes for yesterday's problems, our veteran staff helps you develop the ability to create innovative solutions to pick apart whatever arrives after you leave our event.

CYBERFIRE

What is Entry Point?

- Introduction to cybersecurity incident investigation
- Broad, but shallow, exposure to the three Cyber Fire categories:
 - Host forensics
 - Network archeology
 - Malware analysis
- Targeted at novices or those wanting *some* exposure to all the categories
- If you don't think you're in the right class, talk to us!

CYBERFIRE

Topic Outline

- Working in Linux
- File Analysis
 - Signatures
 - Metadata
 - Hashing
- Host Forensics
 - Order of Volatility
 - Memory Forensics
 - Forensic Disk Imaging
- Networking Overview
 - Networking Stack
 - Packet Capture
 - Routing and Protocols
- Network Scanning
- Malware Analysis
- File Carving
- Incident Reporting

CYBERFIRE

Hands On Training

Throughout the course, we will include a set of puzzles at the end of each topic. These puzzles will reinforce the core concepts you previously learned with hands on exercises.

<https://entrypoint.cyberfire.training>

Workstation Introduction

Created by:
Aaron Scott Pope <apope@lanl.gov>

CYBERFIRE

SIFT Workstation

- Built from Ubuntu Linux
- Developed and maintained by SANS
- Includes digital forensics toolkit and helpful guides
- The VM provided has a couple additional tools

CYBERFIRE

Getting Around in the SIFT Workstation

Application search/launcher

Terminal (command prompt)

Web browser

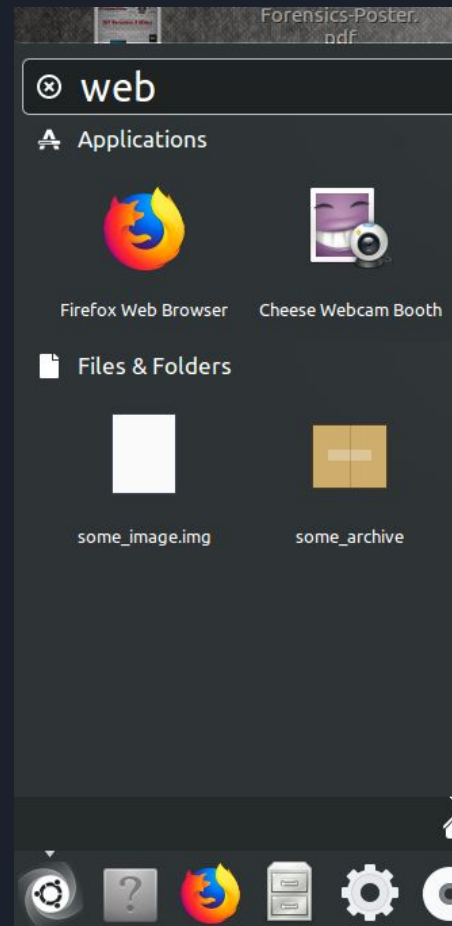

File manager

Search Your Computer

Search for
programs
and files

CYBERFIRE

Terminal Window

Execute
command
line
utilities

A screenshot of a Linux terminal window titled "Terminal". The prompt is "sansforensics@siftworkstation -> ~". The user has entered the command "ls", and the output is a directory listing: "Desktop", "examples.desktop", "Public", "Documents", "Music", "Templates", "Downloads", "Pictures", and "Videos". The prompt is now "\$" with a cursor.

```
sansforensics@siftworkstation -> ~
$ ls
Desktop      examples.desktop  Public
Documents    Music             Templates
Downloads    Pictures          Videos
sansforensics@siftworkstation -> ~
$
```

CYBERFIRE

Navigating the Command Line

- pwd - Print working directory
- ls - List current directory contents
- cd - Change directory
- mkdir - Make directory
- rmdir - Remove empty directory
- cp - Copy file/directory
- mv - Move file/directory
- rm - Remove file
- cat - Print file contents to the screen
- man - View manual page for a program/command

CYBERFIRE

Exercise Time

Puzzle category:

- IntroToLinux

If you get bored:

- IntroToProgramming

Entry Point

File Analysis

Created by Aaron Pope | apope@lanl.gov

CYBERFIRE

File Types

- Pictures: JPEG, PNG, BMP
- Documents: DOCX, PDF
- Programs: EXE
- Archives: ZIP, TAR

CYBERFIRE

File Extensions

- Windows uses file name suffix or “extension” to determine file type
- Tells Windows how to use the file (what program)
- Can be easily changed to hide the nature of a file (e.g., virus.exe → totally_not_a_virus.txt)

CYBERFIRE

File Signatures

- Non-Windows operating systems typically rely on file “signatures”
- AKA “file magic” or “magic numbers”
- Not as easy to change (doing so usually breaks the file)

CYBERFIRE

File Signatures

- Information at the beginning (and sometimes end) of a file
- View the file in a hex editor (e.g., Bless)
- Common file signatures can be found online:
www.garykessler.net/library/file_sigs.html

CYBERFIRE

Why Do File Signatures Matter?

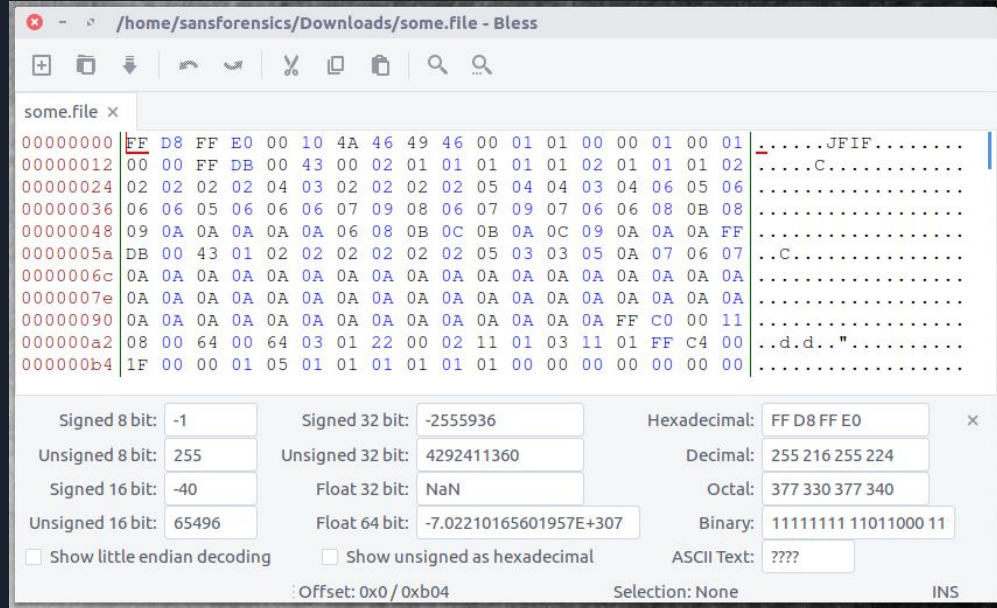

- Can identify file type when extension has been removed or modified to hide the nature of the file
- Can be used to reconstruct files from raw data when file meta-information is lost
 - Corrupted or deleted data
 - Extracting files from memory image

CYBERFIRE

Hex Editor (Bless)

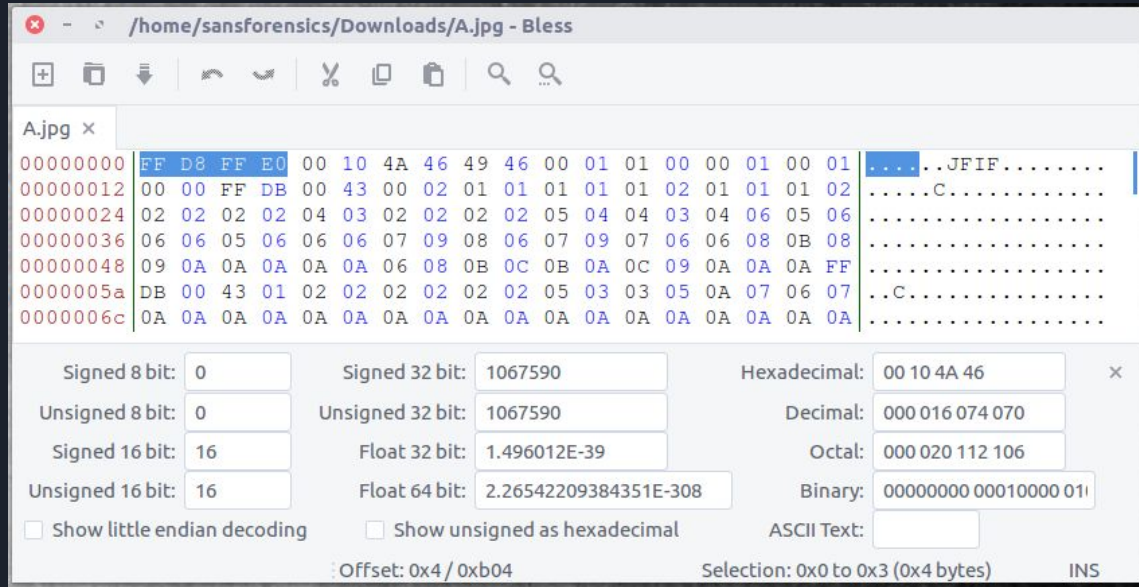

- Displays raw binary contents
- Translates contents into ASCII (text)

Viewing File Signatures

Example
JPEG image
file (.jpg)
begins with
FF D8 FF E0
(file header)

Some file formats, such as JPEG images, also include file trailers

CYBERFIRE

Common File Signatures

File type	Extension	Signature
JPEG Image	.jpg	FF D8 FF E0
Win/DOS Executable	.exe	4D 5A
Zip Compressed File	.zip	50 4B 03 04
GIF Image	.gif	47 49 46 38
PDF Document	.pdf	25 50 44 46

Find other common file signature formats:
www.garykessler.net/library/file_sigs.html

CYBERFIRE

Automated File Signature Analysis

- Linux file command reads file signatures
- Windows versions can be found
(gnuwin32.sourceforge.net/packages/file.htm)

```
Terminal
sansforensics@siftworkstation -> ~/Downloads
$ ls
A.file B.file C.file D.file E.file
sansforensics@siftworkstation -> ~/Downloads
$ file A.file
A.file: PNG image data, 100 x 100, 8-bit grayscale, non-interlaced
sansforensics@siftworkstation -> ~/Downloads
$
```

CYBERFIRE

Automated File Signature Analysis

- TrID File Identifier
- Uses logic to guess file type from signatures

```
Terminal
sansforensics@siftworkstation -> ~/Downloads
$ ls
A.file B.file C.file D.file E.file
sansforensics@siftworkstation -> ~/Downloads
$ trid A.file

TrID/32 - File Identifier v2.24 - (C) 2003-16 By M.Pontello
Definitions found: 12025
Analyzing...

Collecting data from file: A.file
100.0% (.PNG) Portable Network Graphics (16000/1)
sansforensics@siftworkstation -> ~/Downloads
$ █
```

CYBERFIRE

File Meta-Information

- Some file types have extra (meta) information stored in their file headers
- Examples:
 - GPS coordinates stored in pictures taken by phones/digital cameras
 - PDF Author information

CYBERFIRE

View and modify file
meta-information

ExifTool

```
Terminal
sansforensics@siftworkstation -> ~/Downloads
$ ls
A.file B.file
sansforensics@siftworkstation -> ~/Downloads
$ exiftool A.file

$
```

CYBERFIRE

File Hashing

- Generates a "fingerprint" used to identify files
- Based on contents of a file; name not included
- Small change to the contents = big change to the hash
- Commonly used file hash techniques:
 - MD5
 - SHA-1
 - SHA-256
 - SHA-512

CYBERFIRE

File Hashing on Linux

```
sansforensics@siftworkstation -> ~/Documents
$ md5sum hashme.txt
a20ebd903d5d2409048af4fc95612cdf  hashme.txt
sansforensics@siftworkstation -> ~/Documents
$ sha1sum hashme.txt
bd562574087af3144d618fa1764f47703f99e7e9  hashme.txt
sansforensics@siftworkstation -> ~/Documents
$ sha256sum hashme.txt

sansforensics@siftworkstation -> ~/Documents
$ █
```

CYBERFIRE

Exercise Time

Puzzle category:

- FileAnalysis

Entry Point

Host Forensics

Created by:

James Wernicke | wernicke@lanl.gov | @jwernicke

Shannon Beck | shannon@lanl.gov

Aaron Scott Pope | apope@lanl.gov

CYBERFIRE

Introduction to Host Forensics

- Understand basic operating system anatomy
- Live system analysis
- Collect forensically sound evidence
- Static memory image analysis

CYBERFIRE

Chain of Custody[§]

- Chain of evidence / chain of custody
 - Has to be maintained and documented correctly for court-admissible evidence
- [§]Please contact your local legal team for recommendations and procedures for your institution or company

CYBERFIRE

Locard's Exchange Principle

Holds that the perpetrator of a crime will bring something into the crime scene and leave with something from it, and that both can be used as forensic evidence.

- Fingerprints
- Hair
- Digital traces
 - Shell history
 - Master File Table entries
 - Network traffic
 - Registry

CYBERFIRE

Order of Volatility

What happens to your data when:

- Your computer is suddenly turned off?
 - Can you lose information?
- When you reboot, does your computer know:
 - What programs were running?
 - What files were open?

Forensic evidence collection needs to be prioritized by volatility

CYBERFIRE

Cache

Cache memory is more temporary (volatile) than regular RAM memory

Sits with the CPU

Lost if the system is powered down

Most volatile

Least volatile

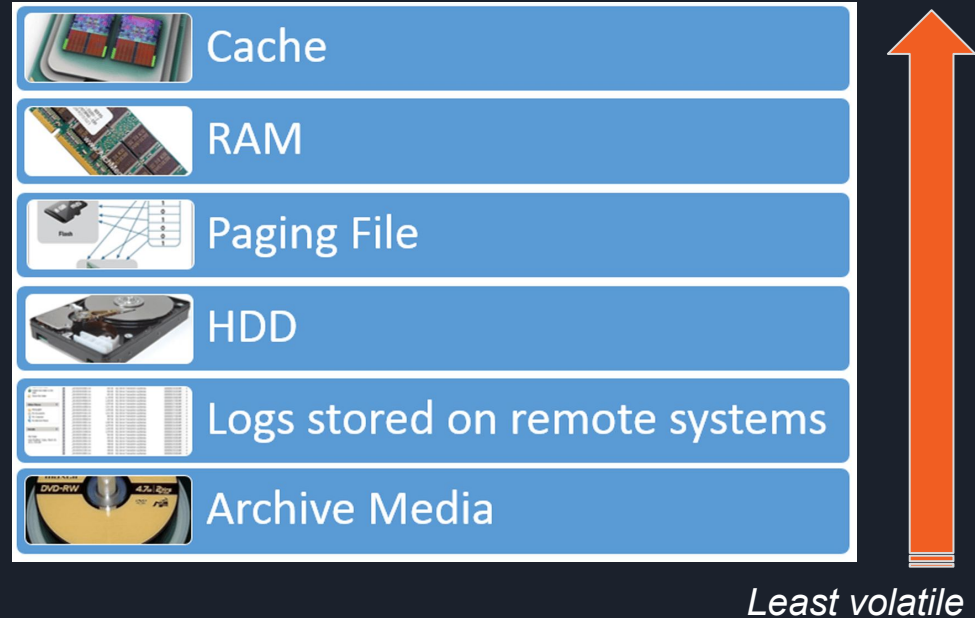

CYBERFIRE

Random Access Memory (RAM)

Slightly less volatile than cache memory

Can include system and network processes information

Lost if the system is powered down

CYBERFIRE

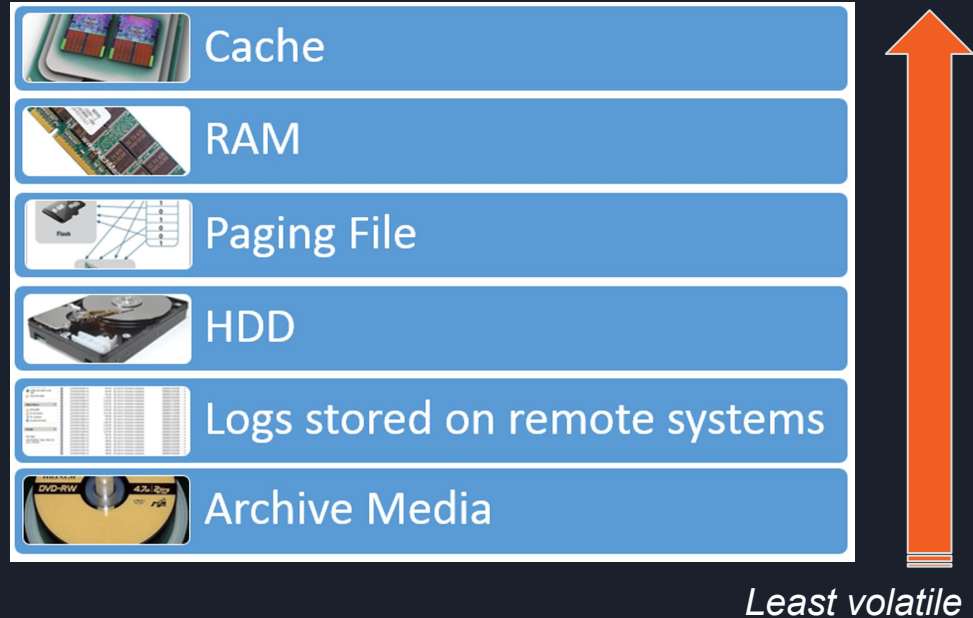

Paging File

An extension of RAM, but stored on the hard drive (HDD)

Paging file

Rebuilt on reboot

More volatile than
“regular” HDD data

CYBERFIRE

Hard Disk Drive (HDD)

Data stored on a hard disk drive (HDD) is semi-permanent

Remains on the hard drive without power / rebooted

Collect the *disk image* versus the *memory image*

Most volatile

Least volatile

CYBERFIRE

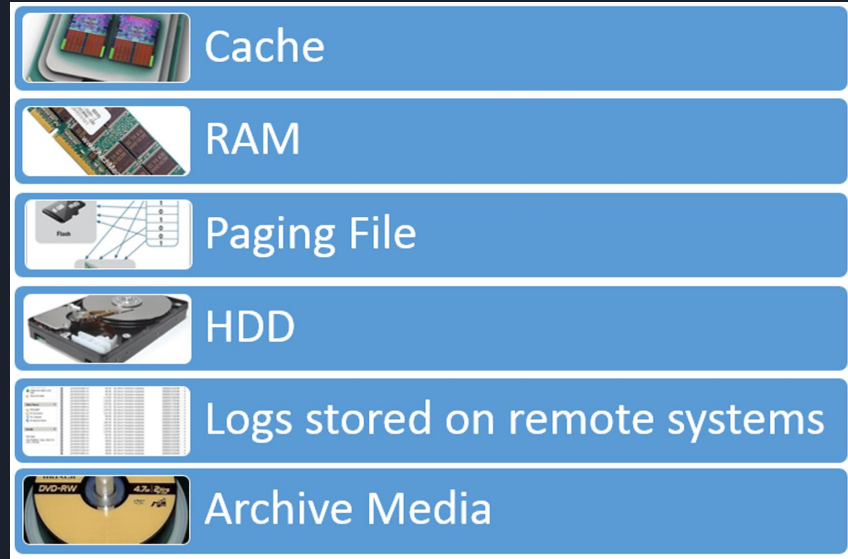

Logs

Your friend!

Any data stored on a remote system is less volatile than data stored on the target system.

Send log data to remote system for:

- Centralized collection and view
- Less volatility
- Searchable (Splunk)

Most volatile

Least volatile

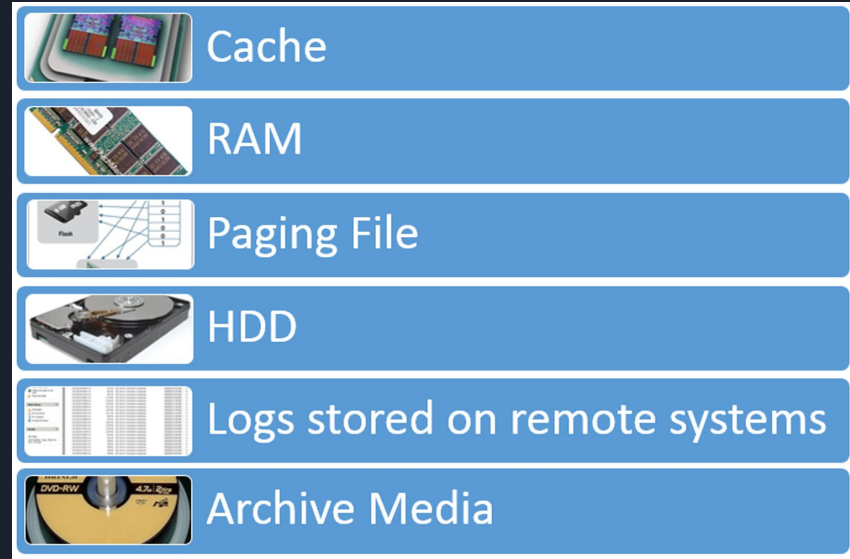

CYBERFIRE

Archive / External Media

Backups / copies for recovery or archive purposes

Generally offline and less likely to be destroyed or corrupted

- Backup tapes
- DVDs
- USBs
- External Drives (tape, USB, cloud, other)

Most volatile

Least volatile

CYBERFIRE

Volatile Forensic Data Collection

Don't just turn off computer if it's suspected something is wrong

Before shutdown, collect what does not persist between reboots:

- Cache
- Memory
- Paging File

CYBERFIRE

What is memory?

Computers use random access memory (RAM) to store recently used programs and data because it is many times faster to read and write data to RAM than hard drives and other types of storage. Today's computers commonly have 16GB or more of RAM which can store a LOT of data and programs. However, RAM is volatile memory so it loses any data stored in it when the computer is shut down.

CYBERFIRE

Live System Analysis

What is a process?

A process is an executing program. An application can consist of multiple processes. Processes are run by a user and inherit that user's privileges. Processes can read and write data as well as execute code. They can also spawn new processes, forming process trees. They often use built-in code libraries called dynamic link libraries (DLLs) that perform common functions without having to "reinvent the wheel".

CYBERFIRE

Forensic Memory Image Collection

Graphical User Interface (GUI) tools available, such as FTK Imager by AccessData, for collecting the contents of memory on a running computer

CYBERFIRE

Forensic Memory Image Collection

Command line tools, such as WinPmem, are more lightweight and less intrusive.

[Pmem](#) is an advanced, free, open-source memory collection tool. It is also quick, requires minimal memory, and can be run from a USB stick. Furthermore, it is compatible with some of the most popular memory analysis tools, including [Rekall](#) and [Volatility](#).

```
Command Prompt
C:\>winpmem-2.1.post4.exe -h

USAGE:

winpmem-2.1.post4.exe [-l] [-u] [--write-mode] [--mode <MmMapIoSpace,
PhysicalMemory, PTERemapping>] [--driver <Path to
driver.>] [--format <map, elf, raw>] [-m] [-p
</path/to/pagefile>] ... [-V] [-d] [-v] [-t] [-i
</path/to/file/or/device>] ... [-e <string>] [-o
</path/to/file>] [-c <zlib, snappy, none>] [--]
[--version] [-h] </path/to/aff4/volume> ...

Where:

-l, --load-driver
    Load the driver and exit

-u, --unload-driver
    Unload the driver and exit

--write-mode
    Enable write mode. You must have the driver compiled with write
    support and be on a system with test signing enabled.

--mode <MmMapIoSpace, PhysicalMemory, PTERemapping>
    Select the acquisition mode. Default is PTERemapping.

--driver <Path to driver.>
    Use this driver instead of the included one. This option is rarely
```

CYBERFIRE

Forensic Memory Image Analysis

- Volatility is a command line tool for inspecting collected memory images
- Rekall is a similar spin-off project

```
$ vol.py --help
Volatility Foundation Volatility Framework 2.6
/usr/lib/python2.7/dist-packages/requests/__init__.py:83: RequestsDependencyWarning: Old
version of cryptography ([1, 2, 3]) may cause slowdown.
  warnings.warn(warning, RequestsDependencyWarning)
Usage: Volatility - A memory forensics analysis platform.

Options:
  -h, --help                list all available options and their default values.
                           Default values may be set in the configuration file
                           (/etc/volatilityrc)
  --conf-file=/home/sansforensics/.volatilityrc
                           User based configuration file
  -d, --debug               Debug volatility
  --plugins=PLUGINS         Additional plugin directories to use (colon separated)
  --info                    Print information about all registered objects
```

CYBERFIRE

Forensic Memory Image Analysis

- Volatility is a web-based graphical user interface (GUI) for working with Volatility
- Results are stored in a database to avoid repeated runs
- Results can be viewed through the web interface or exported for documentation

The screenshot displays the Volatility web interface. At the top, the 'Volatility' logo is on the left, and navigation links for 'Logout', 'Add Plugins', 'About', and 'Help' are on the right. The main content area is divided into two sections: 'Session Information' and 'Image Information'.

Session Information

Session Name	XP (xp.img)
Session ID	5dc30bd7942531002057a93c
Memory File	/home/sansforensics/Desktop/samples/memory/xp.img

CYBERFIRE

Forensic Disk Image Analysis

- Disk image: a snapshot of a hard drive at a given point in time
 - Files
 - Emails
 - Calendar entries
 - Documents
 - Spreadsheets
 - Pictures
 - Malware
 - Cache files from web browsers
 - Master File Table
 - Information about current and deleted files
 - System registries

CYBERFIRE

Forensic Disk Image Collection

Dedicated hardware solutions

- Disk cloning
- Disk-to-file
 - Raw
 - E01
 - DMG

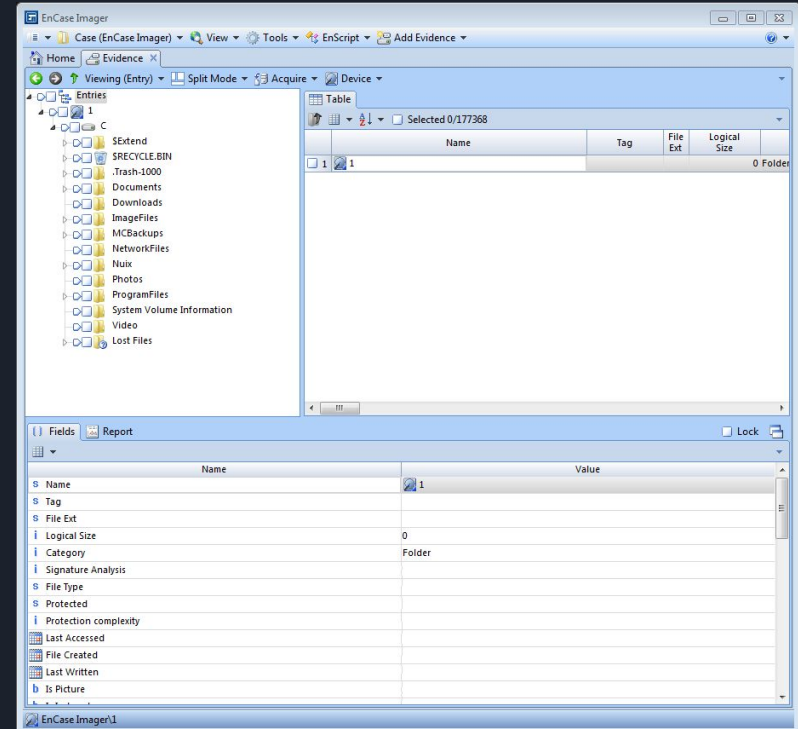

CYBERFIRE

Forensic Disk Image Collection: Windows

- EnCase
- FTK Imager

CYBERFIRE

FTK Imager Lite

- Computer forensic software
- Court-cited disk imaging program
 - Images obtained can be admissible in court
 - Chain of custody and proper procedure
 - Talk to your lawyer, need a write blocker
- Make disk and memory image files
- View evidence disks and image files
- Analyze image and memory files
- Lite is the free version of FTK Imager

CYBERFIRE

More About FTK Imager

- Saves images in multiple formats including
 - .e01, .dd, and RAW
- Recover deleted files
 - Also called file carving, covered in future topic
- Obtain live Windows registry files

CYBERFIRE

Forensic Disk Image Collection: Linux

Raw imaging using dd command

```
root@siftworkstation -> ~  
$ dd if=/dev/sdb conv=noerror,sync bs=128K of=./disk.img  
816+0 records in  
816+0 records out  
106954752 bytes (107 MB, 102 MiB) copied, 0.46575 s, 230 MB/s
```

FTK Imager command line tool

```
root@siftworkstation -> ~  
$ ./ftkimager --help  
AccessData FTK Imager v3.1.1 CLI (Aug 24 2012)  
Copyright 2006-2012 AccessData Corp., 384 South 400 West, Lindon,  
UT 84042  
All rights reserved.  
  
Usage: ftkimager source [dest_file] [options]
```

CYBERFIRE

Forensics File Formats

- Raw (dd): bit-by-bit copy, no compression or error checking
- Expert Witness Format (ewf): redundant integrity checking
- EnCase's Evidence File (.E01) Compressible, searchable
- Advanced Forensics Format (AFF): compressible, extensible, open source format
- Access Data (AD1): logical format doesn't capture slack space

Network Layers

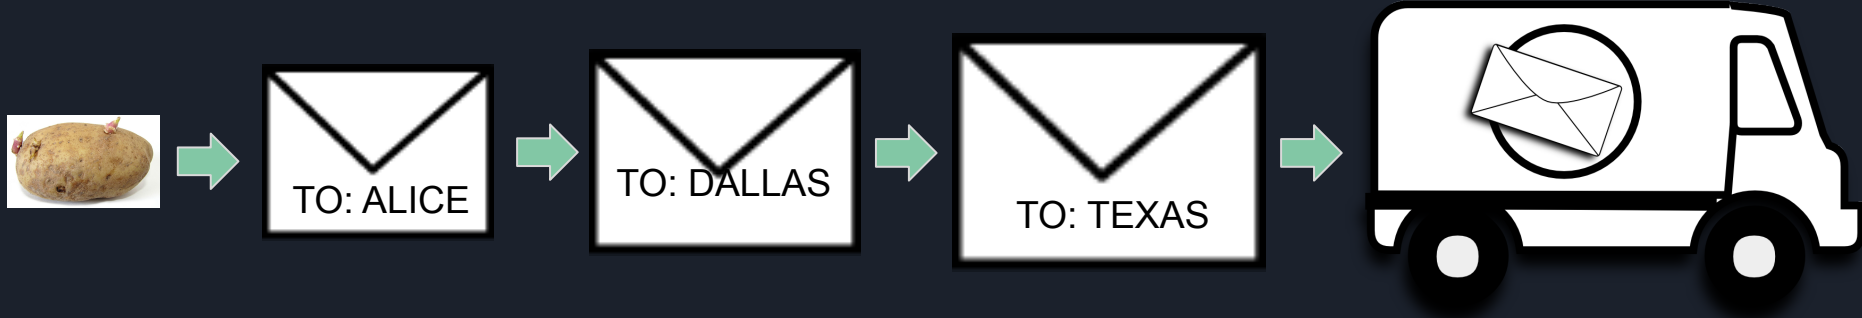

Created by Neale Pickett | neale@lanl.gov
and Aaron Pope | apope@lanl.gov

CYBERFIRE

Computer Network Communications

- Communication happens in chunks known as “packets”
- Packets are layered
- Imagine sending a letter in an envelope, inside another envelope, ...
- Each “envelope” has information about what to do with the contents

CYBERFIRE

Computer Addresses

- Computers have multiple addresses for different purposes:
 - Hardware address
 - Internet address
 - Local network address
 - Domain name
 - Port (application)

CYBERFIRE

Hardware Address

Media Access Control (MAC) Address

- Example: a0-b1-c2-d3-e4-f5
- Associated with the network interface
 - A computer can have multiple
- Typically permanent, but can be changed
- MAC address can often be used to identify the make and model of the interface

CYBERFIRE

Internet Address

Internet Protocol (IP) Address

- Example: 172.217.0.46 (IPv4)
- Most addresses are public (internet-wide)
- Some are reserved for private networks
- IPv4 addresses are running out
- IPv6 to the rescue!
 - 2001:0db8:85a3:0000:0000:8a2e:0370:7334

CYBERFIRE

Communication Ports

- Lets a computer maintain multiple connections without getting confused
- 0-65535 ($2^{16}-1$)
- 0-1023 are reserved for privileged services
 - 22, 23 : Remote shell access
 - 80 : HTTP (websites)
 - 443 : HTTPS (secure websites)
- Higher ports (1024+) are often randomly generated

CYBERFIRE

Link Layer: Ethernet

Ethernet is what your wireless or wired network interface speaks. It has enough information to be able to talk to neighbors on the same Local Area Network (LAN). Ethernet contains:

- Who's speaking (source MAC address)
- Who this is to (destination MAC address)
- What type of stuff is inside
- How big that stuff is

Link Layer

Network Interface

CYBERFIRE

Internet Layer: IPv4 or IPv6

Your *router* works at the Internet layer, and delivers packets to other routers all over the world. To do this, it specifies:

- Who's speaking (source IP address)
- Who this is to (destination IP address)
- What type of stuff is inside

Internet
Layer

Router

CYBERFIRE

Transport Layer: TCP or UDP

Once a packet has arrived on your computer, the Operating System looks at the transport layer to figure out which program should get the next layer. The transport layer has:

- Who's speaking (source port)
- Who this is to (destination port)
- What type of stuff is inside

Transport
Layer

*Operating
System*

CYBERFIRE

Application Layer: HTTP or SMTP

We're almost there! The application layer could have anything in it: that's up to the application. It could have an email, a movement event for a game, a video frame, or anything else. In our example, it has an HTTP message containing an image.

Since the transport layer had a value corresponding with the web browser in our operating system, the browser gets this message, interprets the HTTP header, and passes the rest on to the imaging routines.

HTTP
header

Application
Layer

*Web
Browser*

CYBERFIRE

Potato Layer?

TCP/IP doesn't specify what happens inside the application layer.

Since this was HTTP, we need to read the HTTP specifications to figure out how to handle the rest of the stuff. We're going to just call it the Potato Layer for now.

Network Archaeology dives deep into the potato layer!

- IPandSubnetting

Entry Point

Networking - Routing

Created by Neale Pickett | neale@lanl.gov
and Aaron Pope | apope@lanl.gov

CYBERFIRE

Computer Addresses Reminder

- Hardware address
 - MAC: a0-b1-c2-d3-e4-f5
- Internet address
 - IPv4: 172.217.0.46
 - IPv6: 2001:0db8:85a3::8a2e:0370:7334
- Application
 - Port: 80

CYBERFIRE

IP Addresses and Subnets

- A **subnet** is a group of machines that can talk to each other without a router.
- Subnets can be different sizes, and are defined by a **netmask**.
- Netmasks are usually specified by **CIDR notation**: the number of bits that specify the subnet.

192.168.27.12/32	1 IP	192.168.27.12
192.168.27.0/24	256 IPs	192.168.27.0 - 192.168.27.255
192.168.0.0/16	65k IPs	192.168.0.0 - 192.168.255.255
192.0.0.0/8	16m IPs	192.0.0.0 - 192.255.255.255

CYBERFIRE

Network Routing

- Computers A, B, and C are on the same subnet
- They can communicate directly with each other without relying on the router R1

CYBERFIRE

Network Routing

R1 serves as the *gateway* for A, B, and C, providing a path to everything outside of their subnet

CYBERFIRE

Network Routing

- Computers X and Y are in a different subnet
- Communication between A and X must go through routers, which connect subnets

CYBERFIRE

Network Routing

To send a message to X, A addresses the message with X's internet address but R1's hardware address

Network Routing

Then, R1 uses X's internet address to determine that it needs to forward the message to R2

Network Routing

Finally, R2 sends the message addressed to X's hardware address

Packet Capture

Created by Neale Pickett | neale@lanl.gov
and Aaron Pope | apope@lanl.gov

CYBERFIRE

Observing Network Traffic

- Transmitting something over a network isn't like sending a physical package
- The intended recipient isn't the only one who can see the message
- Visible to any device on the network
- Generally, devices just ignore messages that aren't for them
- Network taps can observe all messages
- Packet capture: tracking packets seen by a tap
 - Often stored for later analysis

CYBERFIRE

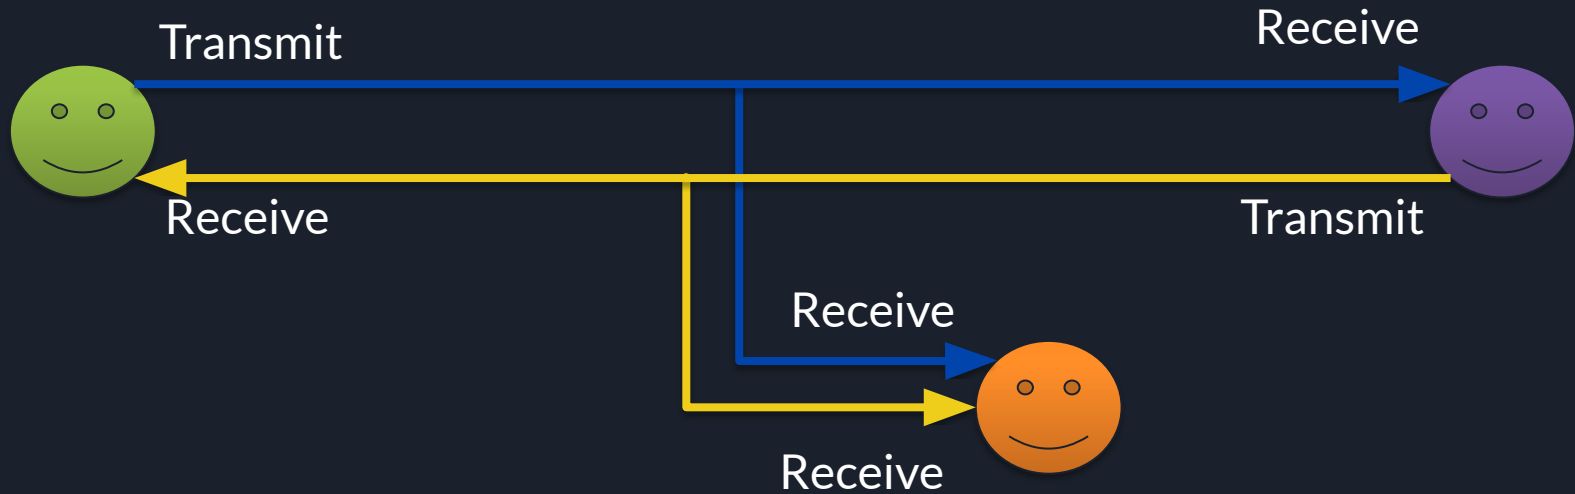

Wire Tapping 101

CYBERFIRE

Wire Tapping 101

CYBERFIRE

Wire Tapping 101: Tap Hardware

Many types of taps exist for various applications and media. But most taps are passive: they only listen.

10 GigaBit Fiber LC Tap

Passive monitoring access for 100% visibility

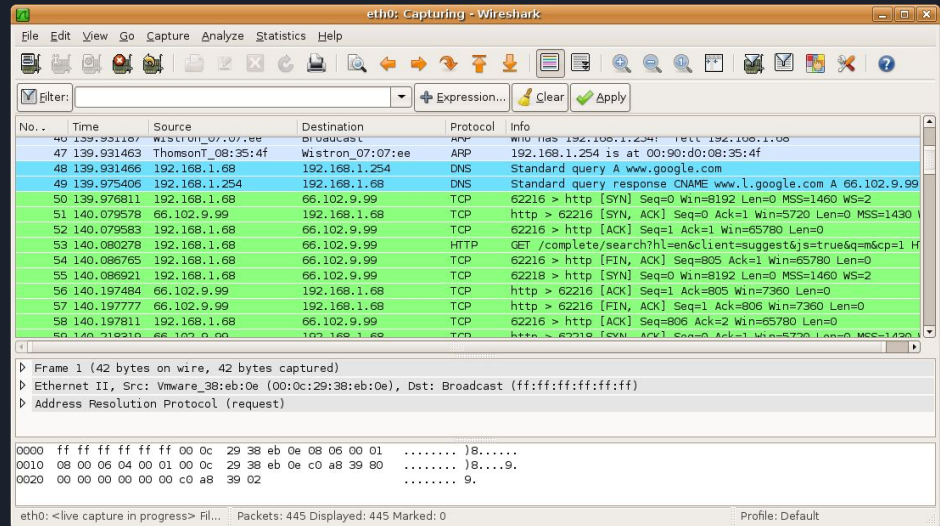

CYBERFIRE

Wire Tapping 101: Wireshark

- Wireshark packet analysis
- Can be used as a “software tap”
- Captures any traffic visible to your computer, including its own
- Store packet capture, or “PCAP” files
- Can be used to analyze PCAP files generated using other software or devices

CYBERFIRE

eth0: Capturing - Wireshark

Entry Point

Networking - Protocols

Created by Neale Pickett | neale@lanl.gov
and Pablo Arias | arias13@llnl.gov

CYBERFIRE

SMTP

- Simple Mail Transfer Protocol
 - Email
 - Has grown less simple over the years
- TCP Port 25
- Client and Server have a back-and-forth conversation
 - It turned out this is really slow over high-latency links
 - This style of protocol is hardly ever used anymore
- Spam wasn't invented until 1994
 - ISPs kept turning off ports to try and prevent it
 - Now only servers speak SMTP to each other

CYBERFIRE

SMTP Example

```
220 WowzaMail Server 14.8
EHLO example.com
250 Hello, nice to meet you.
MAIL FROM: Neale Pickett <neale@example.com>
250 Sender OK
RCPT TO: Shannon Beck <shane@example.com>
250 Recipient OK
DATA
354 Enter mail, end with "." on a line by itself
From: Santa <hohoho@northpole.nl>
To: Timmy <hopalong@cratchit.name>
Subject: You've been a good boy
```

Dear Timmy,

CYBERFIRE

HTTP and HTTPS

- HyperText Transfer Protocol (HTTP) sends HyperText Markup Language (HTML)
 - Links were originally “HyperLinks”, because that sounded cooler to somebody
 - Linking together two resources on different computers was a pretty wild idea in 1989
- TCP port 80
- HTTPS adds encryption
 - TCP port 443
 - The “S” is for “Secure”
- Client asks for something, server responds
 - Only incurs latency twice
- Due to port blocks, almost everything uses HTTPS now

HTTP Example

```
GET /potato.jpg HTTP/1.1  
Host: example.com
```

```
HTTP/1.1 200 OK  
Content-Type: image/jpeg  
Content-Length: 42896
```

```
..JFIF.....
```

CYBERFIRE

Domain Name Service (DNS)

- Finds an IP address from a domain name (google.com)
 - Easier to remember domain names (such as DOE.gov) than to remember an IP address
- UDP Port 53
- Need to have DNS configured or internet will not work properly (to end user)
 - Common DNS Servers: 8.8.8.8, 1.1.1.1, ISP / Employer DNS Server
- Commonly unblocked port, since internet relies heavily on DNS

CYBERFIRE

DNS Example

```
$ nslookup www.doe.gov
```

```
Server:      8.8.8.8
```

```
Address:     8.8.8.8#53
```

```
Non-authoritative answer:
```

```
www.doe.gov    canonical name = www.energy.gov.
```

```
www.energy.gov canonical name = energy.gov.
```

```
Name:         energy.gov
```

```
Address: 199.167.76.59
```

CYBERFIRE

Dynamic Host Configuration Protocol (DHCP)

Assigns dynamic IP address on a network

- Allows network to dynamically assign and revoke IP addresses specified by the network administrator
- Each IP address will contain a lease time that indicates how long a client utilize IP (default is 8 days)
- Number of addresses depends on network configuration (remember subnetting)

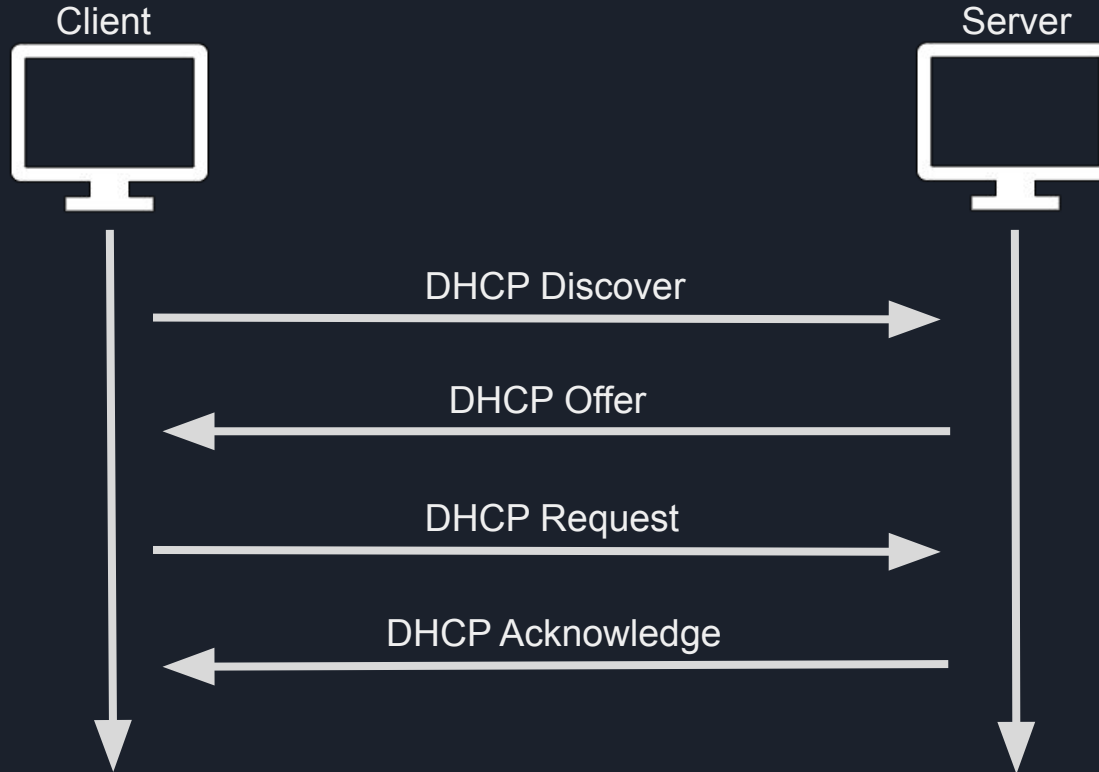

Different from static IP addresses

- Static IP address is manually assigned and will not change
- Will need to let DHCP server know not to offer static IP address (DHCP Reservation)

CYBERFIRE

DHCP Process

CYBERFIRE

Address Resolution Protocol (ARP)

Gets a hardware (MAC) address for an IP

- Each device will contain a unique MAC address that is used to connect to a network
 - Devices may contain more than one MAC address. One for each Network Interface Card (NIC)
- Routers will utilize MAC address to send data between devices
 - ARP will allow the router to know where to route packets to/from each device via MAC address'
- Each device will contain ARP table to cache (store) results

CYBERFIRE

ARP Process in a Local Area Network (LAN)

1. Packet will contain an IP address to which data will need to be sent to/from
2. System will consult ARP table
3. System will send broadcast "Who has IP 192.168.0.58" to everyone in the Local Area Network (LAN)
4. System with IP address "192.168.0.58" will respond with a MAC address.

CYBERFIRE

Network Address Translation (NAT)

Maps one IP address space (like the Internet) to another (like your home network)

- IPv4 - 2^{32} number of IP address' (roughly 4 billion addresses)

Using NAT, a router will allow a device to communicate to public IP address' using an internal private IP address

Reserved internal (private) IP addresses

- 192.168.0.0/16
- 10.0.0.0/8
- 172.16.0.0/12

CYBERFIRE

NAT: How to Assign A DHCP Address

One-to-One Mapping: Static & Dynamic

- Static: permanent mapping between an internal address to a specific public IP address
- Dynamic: mapping between of an internal address to a specific public IP address grabbed from a pool of addresses.

Internal IP	External IP
192.168.0.10	1.2.3.4
192.168.0.11	1.2.3.5

One-to-Many: Port Address Translation (PAT / Overloading)

- Most commonly used form of NAT
- Router will map an internal IP address to a specific port

Internal IP	External IP
192.168.0.10	1.2.3.4:9000

Network Scanning

Created by Aaron Pope | apope@lanl.gov

CYBERFIRE

Network Scanning

- Sometimes the evidence won't be enough to fully understand an incident
- Knowing how an intruder got in might require looking for network vulnerabilities
- Several automated tools to locate, understand, and mitigate security weak points

CYBERFIRE

NMAP: Network Mapper

- Network host and service discovery tool
- Builds a “map” of the network
- Cross-platform

```
Terminal
sansforensics@siftworkstation -> ~
$ nmap localhost

Starting Nmap 7.01 ( https://nmap.org ) at 2019-10-22 13:35 UTC
Nmap scan report for localhost (127.0.0.1)
Host is up (0.000093s latency).
Not shown: 995 closed ports
PORT      STATE SERVICE
22/tcp    open  ssh
80/tcp    open  http
139/tcp   open  netbios-ssn
445/tcp   open  microsoft-ds
631/tcp   open  ipp

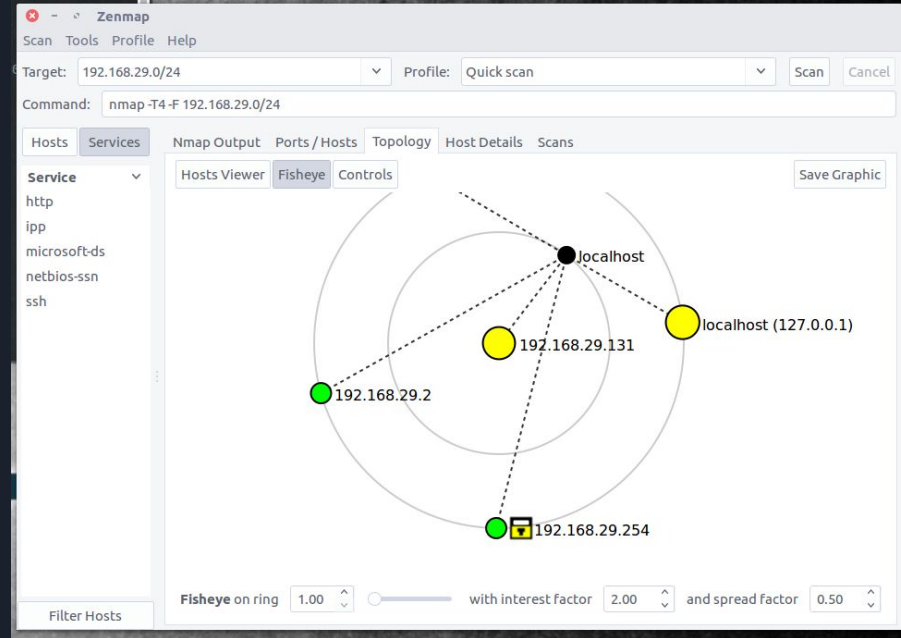

Nmap done: 1 IP address (1 host up) scanned in 0.05 seconds
sansforensics@siftworkstation -> ~
$
```

CYBERFIRE

Zenmap

- GUI and visualizer for NMAP
- Has predefined scan “profiles”

CYBERFIRE

Nikto

- Command line vulnerability scanner
- Checks for unpatched services and misconfigurations

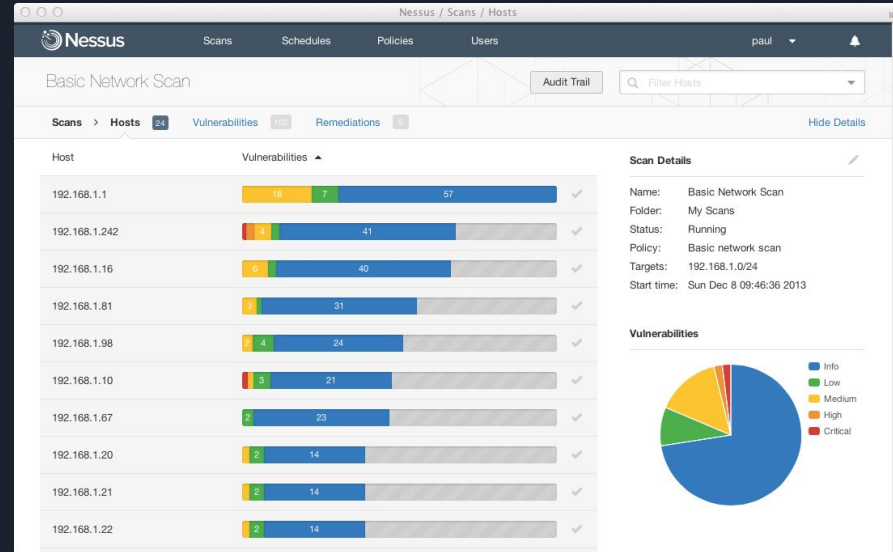

```
Terminal
sansforensics@siftworkstation -> ~
$ nikto -host localhost -port 80
- Nikto v2.1.5
-----
+ Target IP:      127.0.0.1
+ Target Hostname: localhost
+ Target Port:    80

Entry Point

File Carving

Created by Aaron Pope | apope@lanl.gov

File Carving

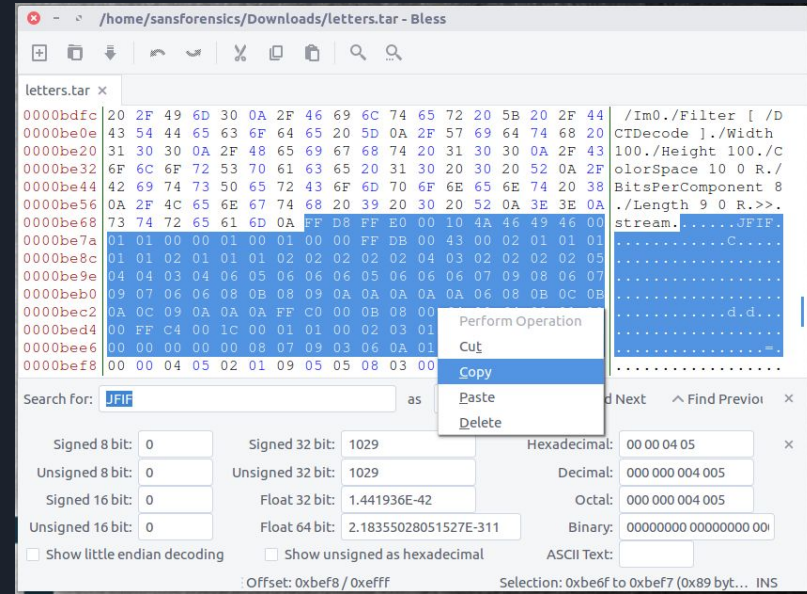

- Extracts file contents from raw information (e.g., memory or disk image)
- Relies on file signatures instead of OS file system management
- Allows recovery of deleted files, or files in formatted/unallocated space

CYBERFIRE

Manual File Carving

- Open raw information in hex editor
- Locate file beginning and end using file signatures
- Copy and paste into new file

Automated File Carving

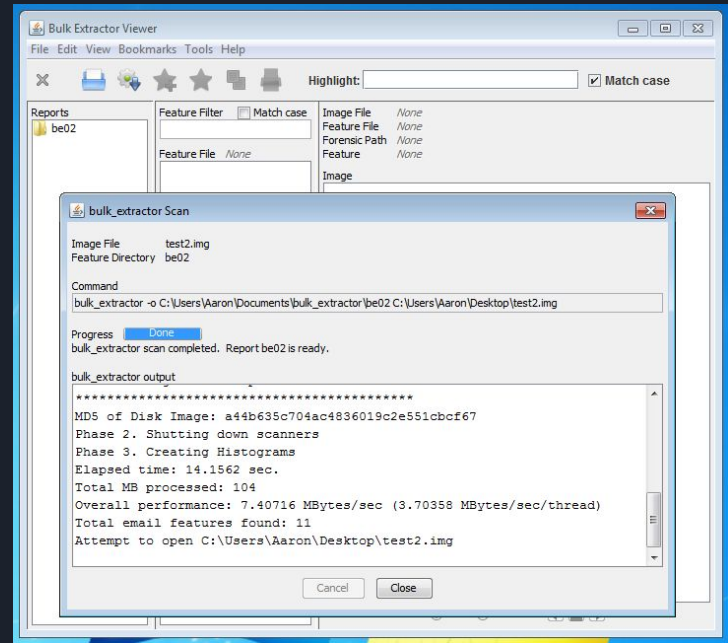

- Exhaustive search for known file signatures
- Finds hidden or deleted files
- Can reconstruct files
- Can be very slow for large drives

Bulk Extractor

- Forensics tool with some limited signature analysis and carving capability
- Only identifies contiguous JPEG, ZIP and RAR files

PhotoRec

- File carving tool specifically for images
- Carves segmented files (unlike Bulk Extractor)

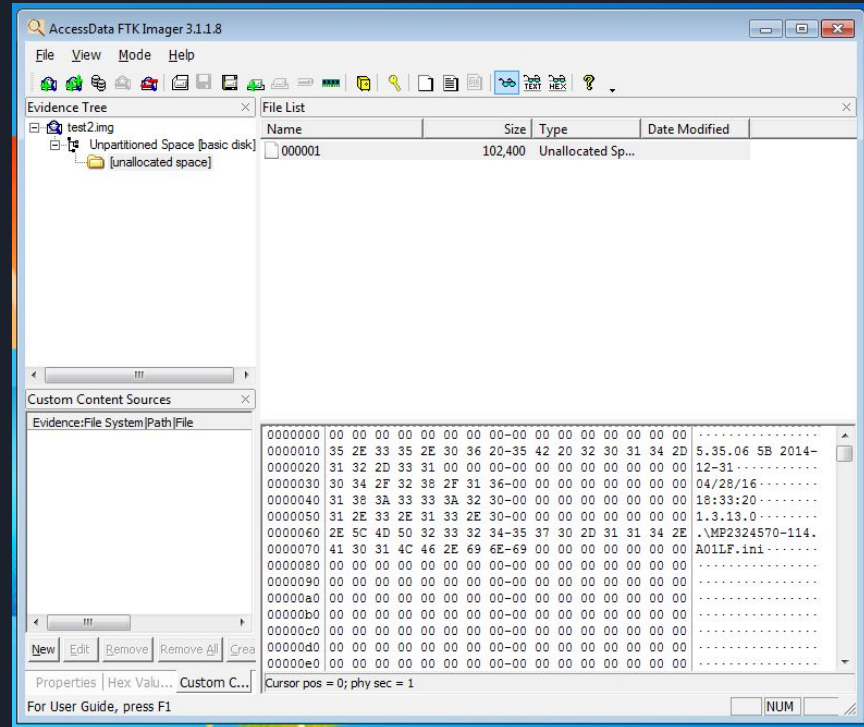

CYBERFIRE

Forensic Toolkit (FTK)

- Commercial forensic imaging software
- Can be used for manual file carving

CYBERFIRE

Scalpel

- Automated command line file carving
- Native to Linux, but can be ported to Windows

```
Terminal
sansforensics@siftworkstation -> ~
$ scalpel -h
Scalpel version 1.60
Written by Golden G. Richard III, based on Foremost 0.69.
Carves files from a disk image based on file headers and footers.

Usage: scalpel [-b] [-c <config file>] [-d] [-h|V] [-i <file>]
              [-m blocksize] [-n] [-o <outputdir>] [-O num] [-q clusterize]
              [-r] [-s num] [-t <blockmap file>] [-u] [-v]
              <imgfile> [<imgfile>] ...

Malware Analysis

Created by Aaron Pope | apope@lanl.gov

CYBERFIRE

Malware Analysis

- Working with live malware is beyond the scope of this class
- However, when investigating an incident, you're likely to come across suspicious files and programs
- What can we do?

CYBERFIRE

Malware Analysis

Plenty of commercial malware scanners available

- McAfee
- Norton
- Symantec

Your institution probably already deploys malware and other host-based detection systems

CYBERFIRE

Malware Analysis

Signature-based detection looks for strings of binary data that has been found in malware

```
strings:  
    $text_a = "wire transfer"  
    $text_b = "CEO"  
    $hex = { E2 34 A1 C8 23 FB }
```

CYBERFIRE

Malware Analysis

Behavior-based detection looks for malicious activities in running processes

- Deleting or encrypting files
- Opening network connections
- Downloading more programs

Can detect malware that has been slightly altered, but still behaves maliciously

Malware Analysis

What if the malware is brand new?

- Zero-day
- Not found in signature databases
- Behavior might be targeted at an organization
- Hand-crafted to elude detection

Bring in the malware analysis experts!

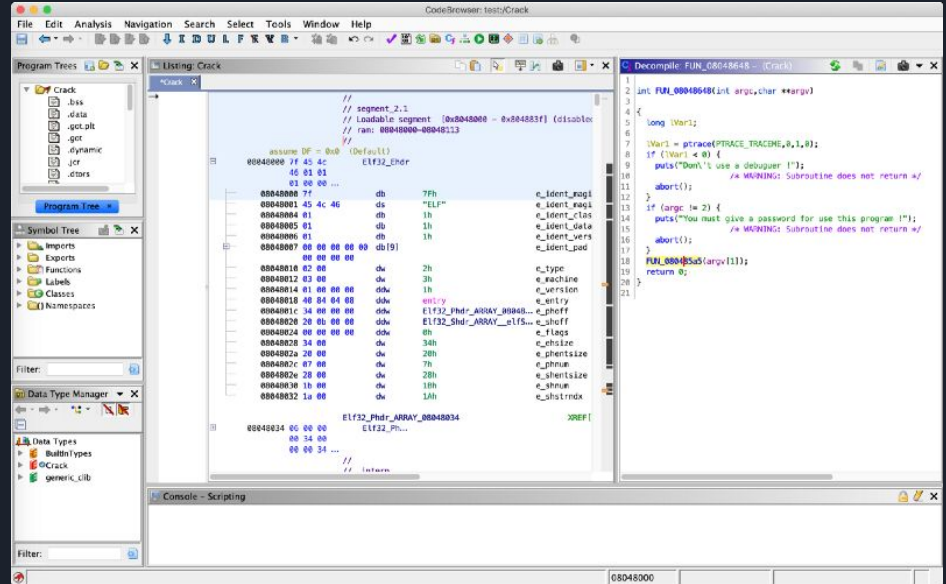

CYBERFIRE

Malware Analysis

Static Malware Analysis:

Reverse engineer the executable to get source code that is easier to understand than machine language

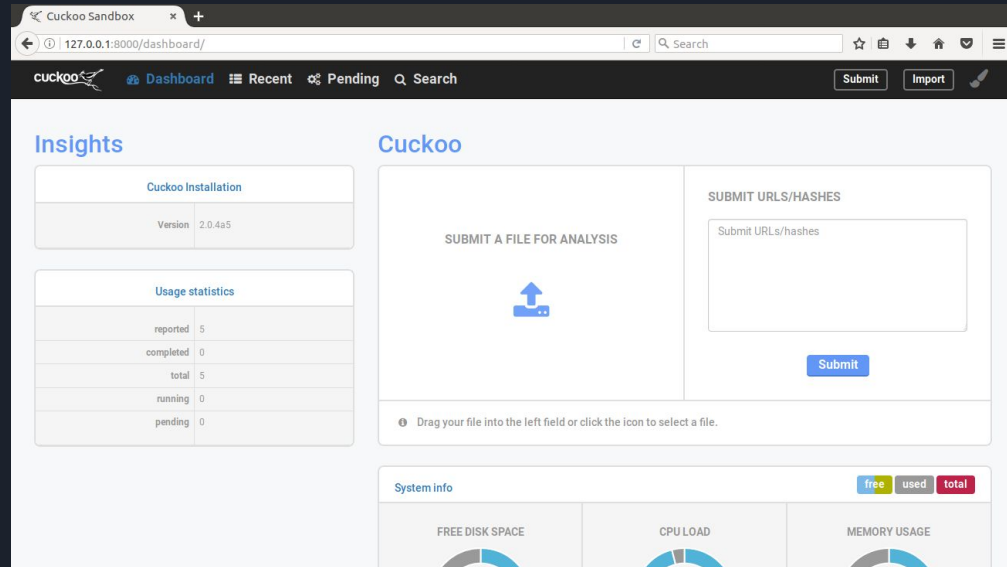

Malware Analysis

Dynamic Malware
Analysis:

Put the suspicious
program in a contained
environment and run it,
watching what it does

CYBERFIRE

VirusTotal

<https://www.virustotal.com/>

VirusTotal, a subsidiary within the Google companies (Chronicle LLC, and Alphabet), is a free online service that analyzes files and URLs enabling the identification of viruses, worms, trojans and other kinds of malicious content detected by antivirus engines and website scanners.

It's a place you can search for, submit, and have your files analyzed
for free.

The screenshot shows the VirusTotal website in a web browser. The browser's address bar displays the URL <https://www.virustotal.com/#/home/search>. The page features the VirusTotal logo at the top, followed by the tagline "Analyze suspicious files and URLs to detect types of malware including viruses, worms, and trojans." Below this, there are tabs for "File", "URL", and "Search", with "Search" being the active tab. A large search input field is centered on the page, with a magnifying glass icon to its right. Below the search field, a small disclaimer states: "By using VirusTotal you consent to our [Terms of Service](#) and [Privacy Policy](#) and allow us to share your submission with the security community. [Learn more](#)." At the bottom of the page, there are four columns of links: "VirusTotal" (Contact Us, How It Works, Best Practices, Terms of Service, Privacy Policy, Join Us), "Community" (Join Community, Vote and Comment, Contributors, Top Users, Latest Comments, Blog), "Tools" (API Scripts, YARA, Desktop Apps, Browser Extensions, Mobile App, Private Services), and "Documentation" (Get Started, Searching, Reports, API, YARA Rules, English (US)).

CYBERFIRE

VirusTotal and Operational Security

VirusTotal and confidentiality from <https://www.virustotal.com/en/about/>

...Additionally, **all files and URLs enter a private store that may be accessed by premium (mainly security/antimalware companies/organizations) VirusTotal users so as to improve their security products and services.**

New language: YOU FURTHER AGREE THAT YOU WILL ONLY UPLOAD SAMPLES THAT YOU WISH TO PUBLICLY SHARE

VirusTotal and Operational Security

How is this a problem for operational security (Ops Sec)?

- Accidental upload of PII
- Unwanted disclosures of sensitive or proprietary data
- Malware targeting specific sites
 - Announcing to the threat actor you think there is a problem

Can VirusTotal still be helpful?

- Probably, through the use of file hashes
- You'll learn more in the exercise

Entry Point

Incident Reporting

Created by
Shannon Beck | shannon@lanl.gov
Pablo A. Arias | arias13@llnl.gov

CYBERFIRE

Who do you report to?

- Different names and different functionality
- Common names
 - SOC: Security Operations Center
 - NOC: Network Operations Center
 - CIRT: Computer Incident Response Team
 - CSIRT: Computer Security Incident Response Team
 - ?? What are your network security folks called?

CYBERFIRE

What to submit?

Depends on who you are submitting to and what you are submitting.

- Suspicious email
- Questionable document
- System memory image

CYBERFIRE

Once you *suspect* something is wrong...

Report it according to your local policy!

Ask the right questions

Who, what, why, when, where and how around an event or incident should include but is not exclusive to the following questions:

- **Where** did the analyst look for the data?
- Were there any suspicious file executions?
- **How** did the analyst identify hosts involved in the incident?
- Is there any traffic to the IP or domain?
- Where was the origination of the alerts? Should that be of more concern?
- **What** is causing the alert? Is it normal or suspicious?
- What actors are involved in the activity? Who are the users involved?
- **Who** received the suspicious emails?
- The questions need to be communicated clearly in the documentation as well

CYBERFIRE

Data – Where Did it Come From?

- Document where the data came from!
- Follow local procedures
 - Memory image? From what system?
 - Disk image?
 - What process / tools did you use?

Notified that 192.168.0.2 (hostname: magicDog.cyberfire-training.org) was sending what looked like Command and Control (C2) traffic. Remotely logged on to the host via [Encase / Remote Desktop / another tool]. Used [FTK Imager Lite / RedLine / Encase] to take a memory image.

CYBERFIRE

The “How”

- How did the analyst identify hosts involved in the incident?
 - Is there any traffic to the IP or domain?
- The “how” can be just as important as the “what”
 - Searched the network logs and found traffic to suspected bad IP address [list IP / domain name here; IP addresses can map to many domain names]. The hosts communicating with that address are 192.168.0.2, 192.168.0.24, and 192.168.0.56.
- What process / tools did you use? Document!

CYBERFIRE

The “When”

- When was the incident response team alerted?
- When were the files you are investigated created, modified, deleted?

Need to account for system time!

- Will impact things such as timekeeping, travel, billing, record keeping, forensic file information, anything with a timestamp.
- Not only do you need to be aware of your own time, but alternate time zones that will impact time correlation

CYBERFIRE

Time Zones

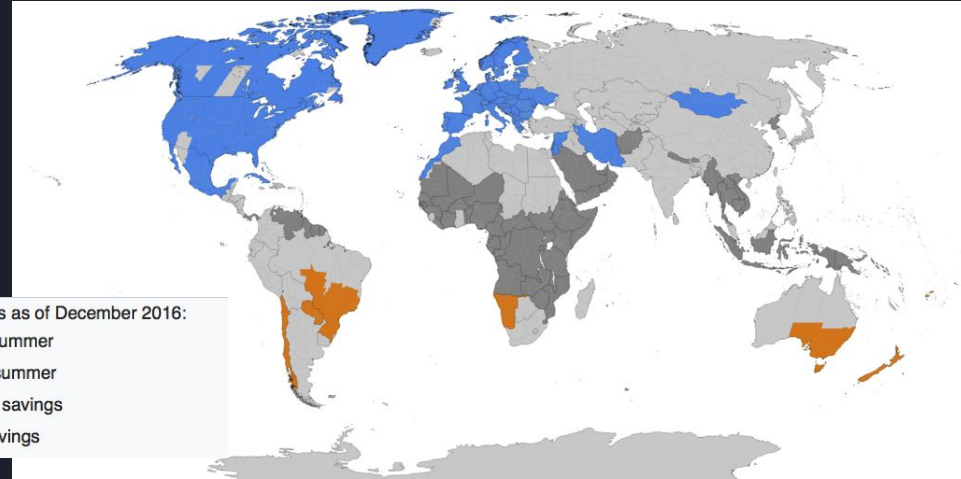

When collecting evidence from a computer – know what time zone it is in

Daylight savings

vs. Standard time

Daylight saving time regions as of December 2016:

- Northern hemisphere summer
- Southern hemisphere summer
- Formerly used daylight savings
- Never used daylight savings

CYBERFIRE

Time – GMT, UTC, and Zulu

- UTC: Coordinated Universal Time (time standard)
- GMT: Greenwich Mean Time (time zone)
- "Z" (phonetically "Zulu") to refer to the time at the prime meridian (military/aviation)
- 2002-10-27 06:00:00Z

CYBERFIRE

Time Drift

- Need to be wary about time drift
- Systems will not always keep the correct “true” time
 - NTP - Network Time Protocol
- When an alert fires on a host is not always when another system may receive the alert
 - Sending and receiving alerts takes TIME
- Consider any issues that could impact recorded time:
 - Log backfill
 - Network range
 - etc

CYBERFIRE

Common Sensors and Alert Sources

IDS/IPS device and signature type (Snort, BRO, etc.)

Host-based detection (Windows logging via WLS or Sysmon; host-based tools such as MIR, Carbon Black, Encase, etc.)

Network traffic visibility (proxies and types, SSL /TLS visibility, IP and domain monitoring and block options)

CYBERFIRE

Alert Origins

Where is an alert coming from?

- External source
- Internal source
- Security appliances (F5, Palo Alto, FireEye, ...)

What process / tools did you use? Document!

CYBERFIRE

Users or Threat Actors Involved

- What users or threat actors are involved in the activity?
- Lateral movement in the network?
 - Does one user suddenly login to 100 hosts in under 1 hour?
- External users logging in from unusual geo locations?
- Attacker attribution
- “Bad” users shows history of:
 - Downloading malware / adware / spyware
 - Phishing attack
 - Gave login credentials at spoofed login page for a legitimate account
- Protect user and host information
- **Caution:** Attacker attribution can change classification levels

CYBERFIRE

Phishing

Phind the phish

"Phishing" is when email purporting to be from a legitimate source attempts to trick you into volunteering your personal or credential-related information. These messages vary in content, but all claim to be from legitimate sources such as E-Bay, your bank, PayPal, or a university group.

If you receive such a message, you should forward it as an attachment to phish@unc.edu.

ITS

INFORMATION TECHNOLOGY SERVICES

CYBERFIRE

Phishing

Emails crafted to appear from legitimate sources

Major vector of infection

- In one study, 45% of the members clicked on unknown links in emails
- <https://blog.barkly.com/cyber-security-statistics-2017>

Document?

Document!

Then inform the right parties and share what you know and have documented.

If you get bored:

- Capstone

Entry Point

Wrap Up

Created by Aaron Pope | apope@lanl.gov

The Capstone Module

- Investigate a mock mini-incident
- Use your new skills
- A couple additional tools introduced

CYBERFIRE

What Now?

- Cyber Fire Foundry is held multiple times a year
- Host Forensics
 - Memory and disk imaging and analysis
 - Digging into process, services, and registry
- Network Archeology
 - Finding adversary activity on a network
 - Unwrapping custom obfuscation protocols
- Malware Analysis
 - Reverse engineering malicious software
 - Analyzing executables' dynamic behavior
- Others:
 - Incident Coordination
 - Operational Technology
